Purification and characterization of two forms of 2,3,4,7,
8-pentachlorodibenzofuran-inducible cytochrome P-450 in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 #binding_site heme iron (Cys) (axial ligand) #status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ##experimental_source liver

Cytochrome P-450 I family consists of two members, IAl and IA2.

Both of them are inducible by 3-methylcholanthrene and 2,3,7,

8-tetrachlorodibenzo-p-dioxin, but have different substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           *superfamily cytochrome P450 electron transfer; endoplasmic reticulum; heme; membrane protein; monooxygenase; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S44151 #type complete

J. BIOL. CHEM. 267:8192-8199(1992).
-!- FUNCTION: CLEAVES PEPTIDE BONDS ON THE C-TERMINAL SIDE OF PROLYL
RESIDUES WITHIN PEPTIDES THAT ARE UP TO APPROXIMATELY 30 AMINO
ACIDS LONG. HAS AN ASSOLUTE REQUIREMENT FOR AN X-PRO BOND IN THE
TRANS CONFIGURATION IMMEDIATELY PRECEDING THE PRO-Y SCISSIBLE
                                                                                                                                                                                                                                                                                     OLIGOPEPTIDES.

C. -I- FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGERARGES. IN LIVER MICROSOMES, THIS ENZYRE IS INVOLVED IN AN UNDAPH-DEPENDENT ELECTRON TRANSPORT. IT OXIDIZES A VARIETY

OF STRUCTURALLY UNRELATED COMPOUNDS, INCLUDING STEROIDS, FATTY

C. -CATALYTIC ACTIVITY: H + REDUCED FLAVOPROTEIN + O(2) = ROH +

COXIDIZED FLAVOPROTEIN + H(2)0.

C. -CATALYTIC ACTIVITY: RH + REDUND.

C. -CATALYTIC ACTIVITY: FOUND IN LUNG AND LIVER.

C. -INDUCTION: BY 3-METHYLCHOLANTHRENE.

C. -INDUCTION: BY 3-METHYLCHOLANTHRENE.

C. -I SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

INHIBITED BY THE DIURETIC AMILORHOR DENDIATE THE ELECTRODIFFUSION OF THE LUMINAL SODIUM WATER, WHICH FOLLOWS OSMOTICALLY)

THROUGH THE APICAL MEMBRANE OF EPITHELIAL CELLS. CONTROLS THE REARSORPTION OF SODIUM IN KIDNEY, COLON, LUNG AND SWEAT GLANDS.

ALSO PLAYS A ROLE IN TASTE PERCEPTION.

Mean 16.646; Variance 42.058; scale 0.396 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                     The moroging melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

The immunise animal against melanoma.

The immunogenic peptide is derived from cDNA25 (R84854), a melanoma antigen derivative of gp100 (see R84855). The peptide and its derivative of gp100 (see R84855). The medicaments (vaccines) for the treatment or prevention (by immunization) of melanoma. Antibodies against melanoma-specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state

(melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 22-74; 40pp; English.

Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when readiolabelled, they may be used to identify tumour deposits.

gp100 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-1ymphocytes, and is a derivative of the melanoma-specific antigen CDNA25 (see R84854). gp100 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunogenic peptides may be used in the detection and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding melanoma antigens recognised by T-lymphocytes - also

                                                                                                                                                                                                                    DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Claim 81; Fig 54; 184pp; English.

Claim 81; Fig 55, 184pp; English.

Claim 81; Fig 54; and is a derivative of the melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanocyte-melanoma-specific antigen spilo (see R84199) which are optionally modified (see R84200-R8411) to enhance their binding to a MHC molecule and used in medicaments, especially vaccines, for the treatment or cused in medicaments, especially vaccines, for the treatment or cused in medicaments, especially vaccines for the detection and its immunogenic peptides may be used in the detection of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            National Variable Var
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

071560 encodes R60618 the murine type II interleukin-1 (IL-1)
receptor isolated from the 702/3 cell line. This protein along with a suitable diluent and carrier forms a therapeutic composition, which can be used to suppress IL-1 dependent immune responses in humans. The soluble protein can also be used in the clinical treatment of autoimmune diseases, such as rheumatoid arthritis, diabetes and

Column 39-44; 28pp; English.

Mouse type II (B-cell) interleukin-1 receptor (IL-IR) precursor (R85481) is the product of a cDNA clone (705727) obtd. from a cDNA library prepd. from pre-B cell line 702/3 (ATCC TIB 158).

Interpretative protein) is used in the assay of type II IL-IR, in raising antibodies to type II IL-IR, and to suppress alloantigen induced immune responses.
              The Type II IL-1R coding sequence was isolated by the method of Rabid Amplification of CDNA Ends (RACE) using RNA from the murine pre-B cell line 702/3 the amino acid sequence of the receptor was deduced from the CDNA. A soluble fragment of the receptor protein is separately claimed (i.e. amino acids 14 to 356, the mature protein up to the transmembrane region). See also Q15267. Sequence 410 AA;
                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid encoding very low density lipoprotein receptor - used to develop prods. for treating e.g. hyperlipidaemia for screening assays and for diagnostic imaging Claim 2; Page 44; 59pp; English.

This protein may be expressed recombinantly in a transgenic animal. By elevating levels of a VLDL receptor in an animal, the receptors will aid in removal of circulating VLDL and related lipoproteins to decrease the risk of developing coronary diseases. It may be used in the treatment of e.g. hyperlipidaemia, atherosclerosis or hypercholesterolemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rabbit apo-E lipoprotein receptor - with DNA sequence coding specified aminoacid in protein claim 1; Page 7; Hpp; Japanese.
The sequence shows an apo-E lipoprotein receptor. The gene was isolated from a cDNA library extracted from liver, heart and spleen of a normal rabbit. The gene was cloned and expressed in G418-resistant cells. Positive clones were isolated by testing their Beta-very LDL binding activity. Transfected cells showed LDL and VLDL binding activity. The receptor has high tissue specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Clostridium
histolyticum collagenase - e.g. for releasing cells from tissue
or treating slipped discs.

Disclosure: Page 36-41: 64pp; English.

A collagenase gene was identified in a pRK290 library containing C.
histolyticum ATCC 21000 DNA. The insert was placed in opposite
orientations in pCT6 and pCT7, serially delated and sequenced
(Q54844). The gene was incorporated into a plasmid vector for
expression in a host cell, esp. Escherichia coll. Recombinant
collagenase (R52579) is 25-100% more active than native collagenases,
and can be used for any application in which tissue digestion is
required. Termination signal Q54845 is located 11 bp downstram of
the translation terminator, and consists of a stem-loop structure
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R57024;

Example 9; Figure 10; 63pp; English.
The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B phenotypes were associated with glycosyltransferases that converted the H substance associated with the O phenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2gal-
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New DNA sequences encoding enzymes involved in biotin biosynthesis - isolated from Bacillus sphaericus, and transformants useful in fermentative blotin production.

Disclosure; pp; French.

DNA was isolated from B.sphaericus IFO 3525, cut with HindIII and the fragments sub-cloned into pBR322. The recombinant plasmids were used to transform E.coli blo- mutants. Plasmid prG148 was present in one clone (E.coli G600 CNM I-609) which showed complementation for blo C and blo F. The plasmid contains a 4.53Xb insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Blood; group; determinant; antigen; erythrocyte; oligosaccharide; glycoconjugate; glycosphingolipid; glycoprotein; glycosyltransferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B and bio A. The insert present in the plasmid of this clone and the 4.3kb insert from pTG1400 were cloned together in pBR322 to produce a plasmid (pTG1440) which complements biotin auxotrophy in a bio delta
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Features Table.
A second clone was isolated which contained DNA encoding bio D, bio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transformed cells are used to produce biotin by culture in a medium contg pimella exid and/or biotin vitamer. Co-culture of two transformants is preferred where one synthesises the vitamer from pimelic acid and the other converts the vitamer to biotin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
        æ
betal-R. Hence, the primary products of the histo-blood group and B genes are the respective glycosyltransferases. The full sequence of the human transferase A is described in R57011. Sequence 195 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04-DEC-1990 (first entry)
Biotin biosynthesis gene fragment #2 of B.sphaericus IFO 3525.
biotin biosynthesis; fermentative biotin production;
                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

PT ISOLAted DNA molecules - encode human histo-blood groups A-, B-
PT and O-91ycotraniferases -
Disclosure; Figure 3; 63pp; English.
CC The histo-blood group ABH determinants are major allogeneic antigens PR Disclosure; Figure 3; 63pp; English.
CC The histo-blood group ABH determinants are major allogeneic antigens CC In both erythrocytes and tissues of humans. They generally CC CONSTITUTE peripheral parts of the oligosaccharide chains of glycoproteins). It was proposed that the A and B CC proteins (glycoproteins). It was proposed that the A and B CC the H substance associated with fill ylocyltransferases that converted CC the H substance associated with the O phenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine CC alphal-3-galactosamine CC and B genes are the respective glycosyltransferases.
CC and B genes are the respective glycosyltransferases.

As authors translated the codon GAT for residue 110 as As and TGG for residue 256 as Tyr Acinetobacter calcoaceticus RAG-1 has the ability to grow on simple triglycerides such as triacetin; mutants defective in esterase lose this ability.

PROC. NATL. ACAD. SCI. U.S.A. 89:9222-9256(1992).
-!- FUNCTION: BINDS VLDL AND TRANSPORTS IT INTO CELLS BY ENDOCYTOSIS.
IN ORDER TO BE INTERNALIZED, THE RECEPTOR-LIGAND COMPLEXES MUST
FIRST CLUSTER INTO CLATHRIN-COATED PITS.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: ABUNDANT IN HEART, MUSCLE, AND ADIPOSE
                                                                                                                                                                                                                                                                                                                                                Gaps

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                         medicaments (vaccines) for the treatment or prevention (by immunization) of melanoma. Antibodies against melanoma-specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                             25-APR-1996 (first entry)
gp100 melanoma antigen immunogenic peptide (G9-19).
gp100; melanoma antigen recognised by T-cells; MART; melanoma;
                                                                                                                                                                                                                                                                    Kawakami Y, Rosenberg SA;
WPI: 95-382963/49.
DNA encoding melanoma antigens recognised by T-lymphocytes - a vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                      claim 55; Page 131; 184pp; English.
The immunogenic peptide is derived from cDNA25 (R84854), a melanoma antigen derivative of gp100 (see R84855). The peptide and its derivatives (see R84200-R84211) are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 77; DB 15; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         adoptive immuno-therapy
Example 8; Page 53; 148pp; English.

A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (sytotoxic T lymphocyte) epitopes from the group R82098-R82108 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for particular interest. The immunogen can be used for particular in mammals against melanoma peptides which are highly potent stimulators of HIA-A2+CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

pMel.17 - are highly potent stimulators of HLA-A2+CTL's userul in adoptive immuno-therapy sxample 8; Page 53; 148pp; English.

A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R22098-R82108 are of particular interest. The immunogen can be used for

Claim 81; Fig 7A; 184pp; English.

gpl00 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen CNA25 (see R84654). gpl00 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments,
                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20-APR-1996 (first entry)
MART-1 melanoma antigen gp100.
pp100: MART-1; melanoma antigen recognised by T-cell;
cDNAJS antigen derivative; melanocyte; melanoma;
metastatic melanoma; tumour-associated antigen; immunogen;
diagnosis; prognosis; prophylaxis; therapy; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 8: Page 51: 144pp; English.

A melanoma specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphcyte) epitopes from the group R82098-882194 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLS in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoding the immunogenic peptides may be used as primers and probes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents Plasmodium falciparum glucose-6-phosphate dehydrogenase (G6DD). The DNA encoding this sequence was isolated using the primers given in 038806-07. The amplified sequence was used in the production of transformed E. coli which produce a recombinant P. falciparum G6PD. These transformed cells can be used in a method of screening drugs for activity against P. falciparum G6PD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

N-PSDB; Q84626.

New CDNA probe for detecting meth:enyl:tetra:hydro:folate synthetase - to assess usefulness of 5-formyl:tetra.hydro:folate for treating cancer in conjunction with 5-fluoro:uracil bisclosure; Figure 2; 14pp; English.

Human liver MHFS was purified to homogeneity. Purified enzyme was chemically cleaved with cyanogen bromide (CnBr) and enzymatically digested by protease V8. A sequence of only six AAs (R66943) could be established from one of the CnBr fragments due to the small amounts of the purified protein left after purification and was used for MTHFS CDNA cloning. Degenerate oligos corresp. to a mounts of the primar sequenced to amplify a 389 cDNA prepd. from human liver poly(A)+ using a 3' RACE (R66944) protocol. The PCR product was subcloned and sequenced and found to contain nts corresp. to the primar sequence and to an ORF of 97 AAs. This PCR product was then used as a probe to screen the lambda DR2 human liver CDNA library and a clone of 867 bp was obtd. (see Q84626). The resulting protein (R66945) contains two sequenced peptides obtd. from purified MTHFS protein (see I and II FT); an ATP consensus binding site (see III FT) and 4 consensus putative phosphorylation states (see IV FT).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant N-myc proto-oncogene - used for producing antibodies and identifying human cancers and for use in cancer therapy.
Disclosure; Fig 1; 31pp; English.
Human cancers, especially neuroblastoma, retinoblastoma and small cell lung cancer, can be identified and monitored immunologically by detecting the N-myc protein. This is useful in cancer diagnosis and cancer therapy. Polypeptides containing at least 6 amino acids of the sequence provided may be used to raise antibodies specific for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Total dagnosis and therapy, e.g. for treating tumours or promoting wound healing

Claim 6; Columns 47-50; 44pp; English.

Degenerate PCR primers were designed based on two highly conserved

Claim 6; Columns 47-50; 44pp; English.

Degenerate PCR primers were designed based on two highly conserved

crejoons within the CDNA encoding a murine activin receptor, human

and porcine TGF-beta type II receptor and the daf-1 receptor, human

and porcine TGF-beta type II receptor and T36073) were used for

amplifying clones present in a 14.5 day foetal rat urogenital ridge

CNA COS cell expression library. Four clones encoding portions of

control polypeptides (all putative serine/threonine kinases)

were obtained and inserts from these clones were used as probes to

control to 10 inserts from these clones were used as probes to

control to 10 inserts from these clones were used as probes to

type I receptors. Each putative receptor comprises a hydrophobic

signal peptide of 19.23 residues, an extracellular, cysteine-rich,

hydrophobic single transmembrane domain of 100-150 residues, an

intracellular serine/threonine kinase domain of 33-25 residues, an

intracellular serine/threonine kinase domain of 33-25 residues, an

intracellular serine/threonine rich tail. The present sequence

is that of MISN4 which appears to be a functional type II receptor; it requires the presence of a functional type II

receptor to bind ligand and to signal; its kinase activity is required

for signalling and its kinase domain is capable of serine/threonine

creceptor stringent conditions is claimed.

Conditions is claimed.

Conditions of the MISN4 sequence or which is able to hybridise to such DNA

conditions arringed to signal in the conditions.

Conditions is claimed.
                                                                                                                                                                                       New isolated TGF-beta type I receptor DNA - used to develop prods for diagnosis and therapy, e.g. for treating tumours or promoting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New receptors of the transforming growth factor-beta receptor family - comprising Mullerian Inhibitory Substance Receptors and inhibin receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 57; Fig 4; 59pp; English.

Misrl (Q49763) is believed to encode an isoform of the rat

MIS receptor. Misr2A/misr2B (Q49764), misr3 (Q49765) and misr4

(Q49766) are believed to encode monomeric isoforms of the rat
inhibin receptor and/or BMP receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This N-myc protein is encoded by the clone N-myc 1, obtained on screening of a human neuroblastoma cDNA library with probe pNB-1. Constitutive polypeptides, within the C-terminal 394 residues of N-myc, are useful for detecting the N-myc proteins. These are esp. useful for distinguishing amongst morphologically similar tumour types and will eg enable early detection of small cell lung cancers. Peptide VI is an antigenic or haptenic polypeptide defining an epitopic site which is immunologically cross reactive with both N-myc and E-myc. Peptides II and III are capable of eliciting antibodies (Abs) for use eg in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New synthetic polypeptide(s) useful in cancer diagnosis-partic. of neural and neuro-endocrine cancers, are in carboxy region of N-myc protein

Claim 6; Page 24; 63pp; English.
Psf230 protein is administered to humans to prevent transmission of malaria by inducing a transmission blocking immune response. It can also be used to raise antibodies and for T and B cell epitope mapping. Pfs230 induces a high and long-lasting antibody titer and Sequence. 3135 AA;

Mean 23.492; Variance 37.868; scale 0.620 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
